

The following statistics were provided by the Security Institute's (CSI/FBI) 2005 Computer Crime and Security Survey of almost 700 Computer Security Practitioners:

Financial losses resulting from unauthorized use of computer systems is calculated at \$130.1 million.

The average loss for unauthorized access to information increased substantially from \$51,545 in 2004 to \$303,234 in 2005.

The average loss for theft of proprietary information more than doubled from \$168,529 in 2004 to \$355,552 in 2005.

WACKENHUT INFORMATION SECURITY SERVICES

Today, one of the most debilitating risks facing organizations is the vulnerability of information assets to threats from both internal and external perpetrators. Part of the process is to initially recognize the level of exposure and vulnerability due to electronic malfeasance. Once identified, an organization must respond decisively, immediately and discretely to fully protect their interests.

Wackenhut Information Security and Computer Forensic Services provides a responsive and pro-active methodology, through the utilization of state of the art technology and best in class assets. The following are the Information Security Services Wackenhut provides:

Information Security Services

Wackenhut provides Information Security Services for organizations requiring expert assistance in safeguarding their information assets. Commencing with establishing a compliant Information Security Policy and related programs, we balance and satisfy the company's business needs, establishing appropriate levels of security throughout the organization.

Security Assessment

Wackenhut can help your organization assess its Security and verify that all the components of the physical and Information Security Program function as expected. A Security Assessment is broken down into the following:

- Vulnerability Assessment
- Threat Assessment
- Penetration Testing
- Wireless Security Assessment
- Physical Security Assessment
- Social Engineering Penetration Test

Forensic Computer Investigations

Wackenhut can provide the expertise to analyze your systems for evidence of malfeasance and extract such evidence in a manner that will provide for its admissibility in a legal proceeding.

48 percent of the respondents indicated that their organization allocated only 1-5 percent of the total IT budget to security.

Computer Crime and Security Survey (CSI/FBI 2004)

Vulnerability Assessment

Wackenhut's Vulnerability Assessment Service provides customers with both an assessment of the overall security of the organization's systems and a valuable baseline for determining appropriate safeguards. Periodic assessments are a requirement of many compliance initiatives and verify that new system implementations and changes to existing systems have not introduced new, unaccounted for vulnerabilities to the organization.

Threat Assessment

Wackenhut's Threat Assessment Service works in conjunction with the vulnerability assessment to determine the likelihood that an identified vulnerability will be exploited. This is an essential step in determining which vulnerabilities could lead to significant risk exposure if not corrected. With vulnerabilities and threats identified, vulnerabilities can be corrected in the order which eliminates the largest threats to the organization first.

Penetration Testing

Wackenhut's Penetration Testing Service provides a method of evaluating the overall security of an organization's systems by simulating an attack by a malicious hacker. Systematic testing enables an organization to identify and remediate vulnerabilities that may otherwise result in a breach of systems security, compromise of data, and reduced consumer confidence.

Wireless Security Assessment

The rapid deployment of wireless networks has resulted in an unprecedented amount of exposure for an organization's systems and networks. Wackenhut's Wireless Security Assessment Service analyzes current wireless configurations, identifies vulnerabilities, provides recommendations, and assists in vulnerability remediation.

Physical Security Assessment

The integration of physical security and information security can no longer be overlooked. Not only is physical security a requirement of most compliance initiatives, it is a requirement of a truly complete information security protection plan. Wackenhut's Physical Security Assessment provides this integration by validating existing physical security access controls, providing recommendations for methods to improve integration between physical and information security, and implementing the recommendations.

Social Engineering Penetration Test

Wackenhut's Social Engineering Tests assess the effectiveness of security awareness, training, and education (S.A.T.E) programs by attempting to gain access to an organization's systems through non-technical means. Social engineering is a critical component of an information security assessment as it helps to identify areas of weakness in an organization that can not be addressed through technical solutions such as firewalls and intrusion prevention systems.

Forensic Computer Investigations

Computer forensics services can be of invaluable assistance to corporations in investigating fraud, harassment and discrimination, misappropriation of proprietary information, and workers compensation issues. Wackenhut delivers expertise in electronic evidence gathering, critical to the success of civil or criminal litigation. Offending acts might include such information as personal comments pertaining to company leadership, disclosing sensitive information as company financial, payroll information, proprietary plans for marketing or product design, or other proprietary information. It is possible to establish the identity of the party in question and make this information and the process for gathering it admissible evidence in legal proceedings.
