

By selecting Wackenhut to provide you with Risk Assessments, you will be sure to safeguard the future of your business.

We came to the conclusion some months ago that we had a double set of standards for our federal buildings versus our lease buildings...federal being the higher standard.

*William Jenkins, National Realty Services
Officer for Public Building Services of the U.S.
General Service Administration when talking
about the "New Standards for Building Safety -
by Federal Government"*

The more we know about our vulnerability, the better able we are to protect ourselves.

National Strategy for Homeland Security

WACKENHUT RISK ASSESSMENTS

Corporations and Government facilities worldwide are ready to safeguard their future. Many have made risk assessments of their current systems a top priority, others don't have a choice.

Security is typically a reactionary business element of an enterprise. As such, the response to a security issue is often disruptive, time consuming and costly. Changing the reactionary response into a pro-active business process will save a considerable amount of time, effort and enterprise capital. Wackenhut's risk assessment process is the pro-active business solution.

Utilizing highly trained security and engineering personnel, Wackenhut is able to perform complex security risk assessments to all critical infrastructure. Consultants provide assistance in identifying the vulnerabilities and make recommendations for improvement.

Wackenhut's Risk Assessment Services include:

- Risk Assessment
- Program Measurements
- Technology Evaluation and Application
- Security Systems Design
- Master Planning

"There is little that a building owner or local government can do to shield high-rise buildings from the kind of catastrophic attacks that occurred on Sept. 11. Mitigating the effects of an attack, therefore, is of paramount concern. Much can be done in this regard."

Rae Archibald, retired RAND Vice President (RAND - Thinktank for Public Policy Issues)

Risk Assessment

A risk assessment is a tool for measuring the compliance of an organization with applicable security requirements and is a standardized methodology that can be used to analyze a system or organization to identify vulnerabilities potentially resulting in losses. The standardized methodology is based on the inter-relationships of four key factors:

Assets. Any useful or valuable resource.

Vulnerability. Weakness or susceptibility of an asset or a collection of assets to losses of various kinds.

Threat. An event, process or act which, when realized has an adverse effect on one or more assets.

Safeguard. A countermeasure, control or action taken to decrease the existing level of vulnerability of an asset to one or more threats.

Risk = Threat + Vulnerability

Wackenhut's risk assessment will enhance a corporation's existing security program by providing a clear definition of the threats and vulnerabilities and concrete, cost-efficient measures to reduce risks to personnel and assets. Additionally, the assessment will address methods and resources necessary to reduce potential liability issues, and will provide budget estimates and return on investment (ROI) evaluations for recommended actions.

Program Measurements

Security departments provide service to internal customers and every service provider knows that quality must be built into their service offering. However, few of them know how to measure the quality of service they provide. Wackenhut provides proven systems that will demonstrate value through measured results of a corporation's security department. Program validation and practice compliance metrics will help show value and identify areas of improvement.

Technology Evaluation and Application

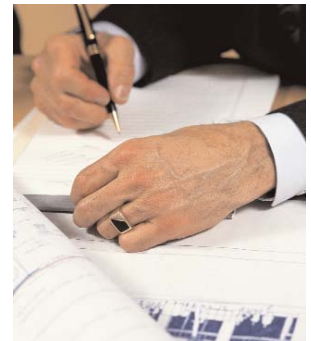

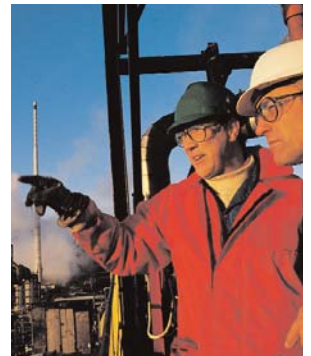

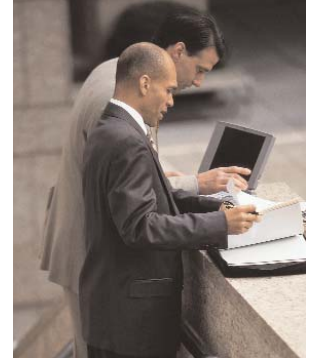

Wackenhut's security engineers actively seek out the best in the vast collection of new security-related technology opportunities. We apply our business expertise and market knowledge to specify effective, vendor-neutral solutions for your organization's applications.

Security Systems Design

Wackenhut's security engineering team offers a full range of design services, from schematic (concept) design through construction documents to construction administration services. Our multi-disciplinary staff has extensive expertise in all types of access controls (including biometric systems), intrusion detection and alarm monitoring, security communications, video surveillance and assessment systems, security lighting, ballistic and forced-entry resistant materials and construction, and more.

Master Planning

Master Planning is important for organizations or businesses that anticipate growth. Wackenhut's master planning consultants work with the organization to help identify their long-term planning goals. We then evaluate the security programs and systems to determine if they match the organization's long-term plans, and we develop multi-phase program modifications to support continued growth
